All About Leukemia, A Book That Tells You All About Leukimia

Synopsis

What is leukemia?Leukemia is a disease that consists of the uncontrolled multiplication of a certain type of cell in the blood. Blood is a tissue of the human body, which is in a liquid state precisely because of the very important function it has to serve as a means of communication and transportation of all the substances necessary to keep all our organs supplied and in proper functioning.

What is acute leukemia?Acute leukemia is a disease of the bone marrow that consists of a rapid and uncontrolled multiplication of very immature malignant leukocytes, called blasts, that do not serve to perform any function and that invade the natural space of the rest of the normal cells of the bone marrow. Their proliferation becomes so excessive that these blasts occupy 20% to almost 100% of the total cells of the bone marrow and can end up being the most numerous cells of the blood.By invading this space in the natural bone marrow of the blood-producing cells, a very serious situation for the patient ends up, in which there will be a shortage of red blood cells (anemia), normal leukocytes (leucopenia) and platelets (Thrombopenia). This severe condition is called medullar insufficiency, and it can also occur in other types of blood diseases.

Chronic LeukemiasChronic leukemias are slower and more progressive diseases in which the aggressiveness of malignant cells is usually much less than that of acute leukemias blasts.
